Design. Manufacture. Support.

OUR COMMITMENT TO YOU

Since the early 1950s, Slater Tools has been dedicated to designing and manufacturing quality precision cutting tools used around the world. Product offerings include rotary broach and punch broach tooling, Go/NoGo inspection gages, spring loaded live centers and screw machine tooling. Through innovation and high standards, our tooling has led the industry, providing dependable and precise solutions for our manufacturing customers in the aerospace, medical, automotive, plumbing, fastener and many other industries.

At Slater Tools, we are able to provide the flexibility and service of a small company with the resources and reliability of a large company. All of our tools are backed by a strong commitment to application assistance and customer satisfaction. All Slater Tools products are proudly designed and manufactured in the USA by qualified, dedicated people using state-of-the-art technology. Slater's complete line of products reduces cycle times, boosts efficiency and increases profitability for our customers' precision machining operations. With over six decades of experience in the industry and hundreds of thousands of tools in operation throughout the world, Slater Tools is THE company for precision tools that take shape.

ORDERING, RETURNS & REPAIRS

To Order Direct

Call: (586) 465-5000 | Fax: (586) 465-3030 | Email: direct@slatertools.com

Monday through Friday, 8:00 a.m. - 5:00 p.m. Eastern Standard Time (EST).

Delivery

Stock orders placed by 4:30 p.m. EST will be shipped the same day. Please allow 1-2 business days for special Internal Hex and Square Broaches. For external and all other special/custom broach or gage forms, please allow 5-10 business days upon your print approval.

Return Policy

Full credit is given for all unused standard catalog items returned within 30 days of the invoice date. All returns require a return goods authorization number.

Factory Repairs and Broach Re-sharpening Services

Upon receipt, an evaluation and price quote will be submitted for your approval before repairs or re-sharpening is done. Please see page 39 for more details.

TECHNICAL SUPPORT

At Slater Tools, we pride ourselves on providing our customers with the most accurate and relevant technical information on the tools of our trade.

If you have any questions about our products or your specific application, please call us at (586) 465-5000, visit our website at www.slatertools.com, or email us at direct@slatertools.com.

INTERNAL HEXAGON BROACHES

Slater Tools offers a large inventory of Hexagon Rotary Broaches. The below listed sizes are available for immediate delivery in a variety of materials and coatings. Additional popular sizes are also available from stock. Slater Tools can make any custom size hex in only 1-2 days. Across-the-flats dimensions conform to IFI and ANSI/ASME standards for maximum tool life. We also offer pressure relief vent holes, quantity discounts and re-sharpening services.

AVAILABLE INTERNAL BROACH OPTIONS:

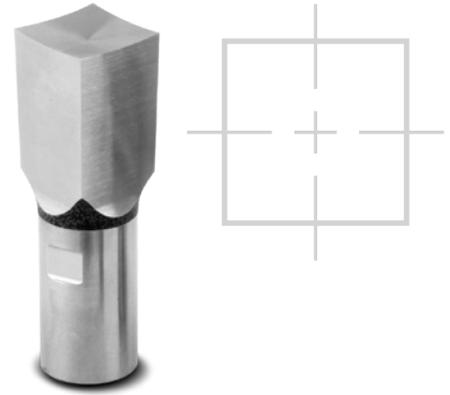

- Coatings: TiN, TiCN, TiAlN
- Materials: M2, PM4, T15 High Speed Tool Steels
- Different overall lengths (including 28mm)
- Custom cut lengths
- Custom across-the-flat dimensions: .028-2.050" (0.70-52mm)
- MICRO forms
- Corner radius
- Spun ground diameter on broach corners
- Single or double vent holes
- Flat on shank can be aligned with flat on form (for holding orientation)
- Re-sharpening
- Quantity discounts at 5, 10, 30, 50, 100, 150, 200 pieces

INTERNAL SQUARE BROACHES

Slater Tools offers a large inventory of Square Rotary Broaches. The below listed sizes are available for immediate delivery in a variety of materials and coatings. Additional popular sizes are also available from stock. Slater Tools can make any custom size square in only 1-2 days. Across-the-flats dimensions conform to IFI and ANSI/ASME standards for maximum tool life. We also offer pressure relief vent holes, quantity discounts and re-sharpening services.

INTERNAL SERRATION BROACHES

Slaters Tools offers precision ground Internal Serration Rotary Broaches designed to be used individually or as mating parts with Slaters External Standard Serration Rotary Broaches (see page 20). When mating the internal with the external serration, there will be a .0028" per side tooth clearance. Internal and External Serration Rotary Broaches can be produced with a variety of custom options. **For all available broach options, see page 13.**

AVAILABLE INTERNAL BROACH OPTIONS:

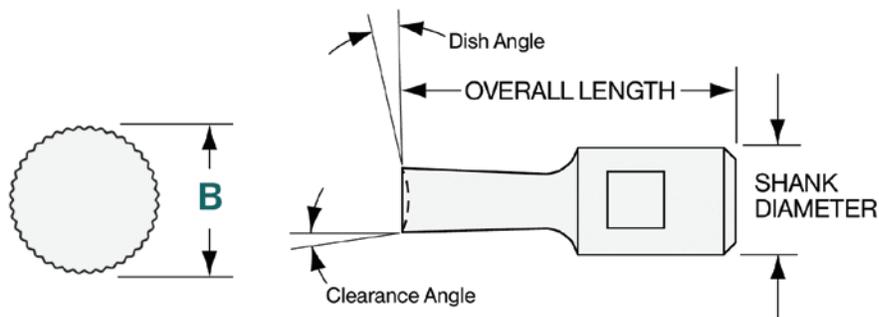

- Coatings: TiN, TiCN, TiAlN
- Materials: M2, PM4, T15 High Speed Tool Steels
- Different overall lengths (including 28mm)
- Custom cut lengths
- Custom major and minor dimensions
- Any desired number of teeth
- Custom tooth profiles
- MICRO forms
- Corner radius
- Spun ground diameter on broach corners
- Single or double vent holes
- Flat on shank can be aligned with flat on form (for holding orientation)
- Re-sharpening
- Quantity discounts at 5, 10, 30, 50, 100, 150, 200 pieces

INTERNAL J500 BROACHES

Slaters Tools offers a variety of Internal J500 Rotary Broach Tools available for quick delivery. Sizes conform to SAE standards and are designed for maximum tool life. J500 Rotary Broaches can be produced in special sizes and custom lengths. They can also be made in a variety of materials and coatings. Vent holes, quantity discounts and re-sharpening are available.

For all available broach options, see page 13.

EXTERNAL SERRATION BROACHES

These precision ground External Serration Broaches are designed to be used individually or as mating parts with Slaters Tools' Internal Serration Broaches (see page 12). When mating the internal with the external serration, there will be a .0028" per side tooth clearance. Internal and External Serration Rotary Broaches can be produced with a variety of custom options.

AVAILABLE EXTERNAL BROACH OPTIONS:

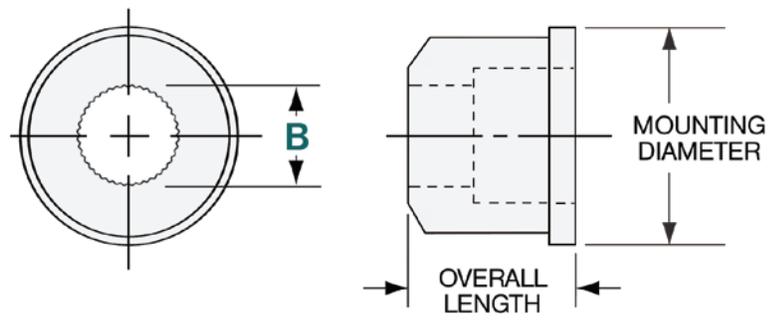

- Coatings: TiN, TiCN, TiAlN
- Materials: M2, PM4 High Speed Tool Steels
- Different overall lengths
- Custom major and minor dimensions
- Any desired number of teeth
- Custom tooth profiles
- Corner radius
- MICRO forms
- Form can be aligned with slot (for holding orientation)
- Re-sharpening
- Quantity discounts at 5, 10, 30, 50, 100, 150, 200 pieces

EXTERNAL J500 BROACHES

Slaters Tools offers a variety of External J500 Rotary Broach Tools available for quick delivery. Sizes conform to SAE standards and are designed for maximum tool life. J500 Rotary Broaches can be produced in special sizes and custom lengths. They can also be made in a variety of materials and coatings. Quantity discounts and re-sharpening are available.

For all available broach options, see page 21.

CUSTOM INTERNAL AND EXTERNAL ROTARY BROACHES

MADE BASED ON YOUR PRINT AND TO YOUR SPECIFICATIONS

Because Slater Tools designs and manufactures everything in-house, we are able to offer extremely quick turn-around time for all special forms. Any internal or external shape can be produced to suit your specific application. Custom broaches can also be made to ANSI and SAE specifications. Our most popular special form broaches include double D, involutes, keyways, serrations, Torx-type (hexalobular), Rosan-type and splines. Custom broaches can be produced with a variety of available broach options.

AVAILABLE BROACH OPTIONS:

- Coatings: TiN, TiCN, TiAlN
- Materials: M2, PM4, T15 High Speed Tool Steels
- Different overall lengths
- Custom cut lengths (internal broaches)
- Custom dimensions
- MICRO forms
- Corner radius
- Spun ground diameter on broach corners (internal broaches)
- Single or double vent holes (internal broaches)
- Form can be aligned with flat on shank or slot (for holding orientation)
- Re-sharpening
- Quantity discounts at 5, 10, 30, 50, 100, 150, 200 pieces

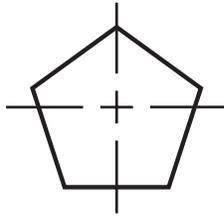

CUSTOM BROACH ORDER PROCESS

- Please submit a portion of your print showing the area to be broached.
- You will receive a quote along with technical recommendations to ensure successful broaching.
- Once the order is placed, we will design your tool and submit a drawing for your approval.
- Manufacturing begins upon approval and takes only 5-10 business days.

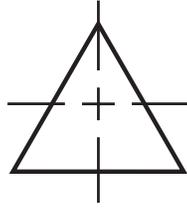

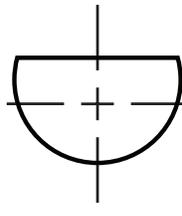

POPULAR CUSTOM SHAPES INCLUDE:

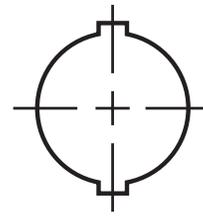

PENTAGON

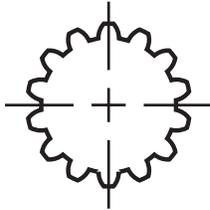

TRIANGLE

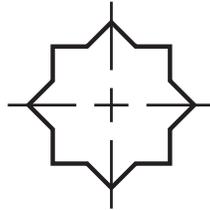

D SHAPE

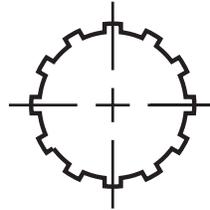

KEYWAY

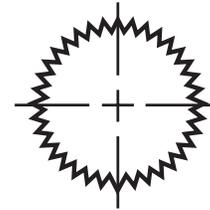

INVOLUTE

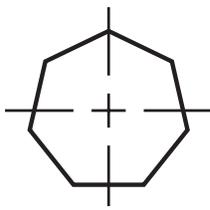

DOUBLE SQUARE

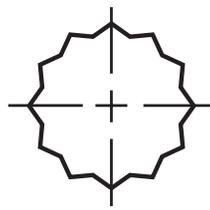

SPLINE

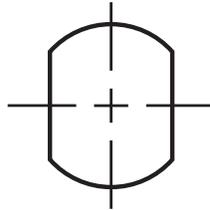

SERRATION/KNURL

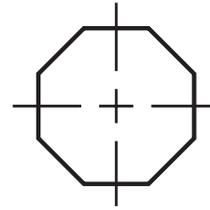

HEPTAGON

DOUBLE HEX

DOUBLE D

OCTAGON

MICRO INTERNAL AND EXTERNAL BROACHES

Slater Tools' Micro-sized Internal and External Broaches are a cost effective and efficient way to make bone screws and other micro fasteners. Micro forms as small as .028" can be successfully rotary broached with Slater Tools' Micro Broaches. External Micro Broaches can be produced to fit onto the Adjustable and Adjustment-Free Internal Tool Holders which greatly reduces manufacturing costs. Using the same tool holder, customers are able to produce both internal/ID and external/OD forms. External forms as small as .056" and up to .225" can be produced to fit the internal holders.

INTERNAL ADJUSTMENT-FREE ROTARY BROACH TOOL HOLDERS

Slaters Tools is the leading manufacturer of high quality, compact Rotary Broaching Tool Holders designed specifically for Swiss type and other precision machines.

The Adjustment-Free Rotary Broach Tool Holder reduces set-up time and helps eliminate operator error in any CNC mill or lathe. Simply set the Adjustment-Free Tool Holder into your machine and you are ready to rotary broach.

INTERNAL ADJUSTABLE ROTARY BROACH TOOL HOLDERS

Slater Tools' Internal Adjustable Tool Holders are known to be the industry's best for reliability and longevity. The ability to be adjusted allows this Rotary Broach Tool Holder to be used on any CNC, Swiss, screw, milling or other turning machine. The tool holder can be adjusted to compensate for variations in machine alignment. This holder also can be used with any overall length broach, which is useful in applications where you may need to reach through a deep counter bore.

INTERNAL ADJUSTABLE TOOL HOLDER BENEFITS:

- Adjustable to compensate for machine alignment/variations
- Flexibility for use of different overall length broaches
- High-durability three piece bearing configuration
- Conveniently offered in different shank sizes
- Industry-best broaching capacity
- Eliminates secondary operations
- Capable of producing small external forms

EXTERNAL ADJUSTABLE ROTARY BROACH TOOL HOLDERS

Rotary broaching has become a popular method of producing external/OD forms. Most external shapes can be produced up to 1.80 inches in diameter using Slaters Tools' External Adjustable Rotary Broach Tool Holders. These tool holders can be used on any CNC lathe, mill, Swiss, screw, machining center or other turning machine and can be adjusted to compensate for variations in machine alignment.

PARTS & ACCESSORIES

Slater Tools provides a variety of parts and accessories for all of our Rotary Broach Tools. We have developed these accessories to enhance and extend the life of our tooling and help our customers get the most out of each broaching application.

ROTARY BROACHING ORIENTATION DOGS

The Rotary Broaching Orientation Dog is used for orientation or alignment of the broach to the workpiece in milling applications. This tool holds the spindle of the Rotary Broach Tool Holder stationary against the stop rod as the tool holder body rotates. Take control of positioning with this unique fixture.

For Tool Holder Series	Part #
0600 and 7600	BOD-7600
0700 and 1760	BOD-1760
3700 and 3760	BOD-3760
3770	BOD-3770
7760	BOD-7760

MOBIL 32 GREASE

Mobil 32 grease is a red synthetic grease without graphite that is ideal for use with Slater Tools' Rotary Broach Tool Holders. Greasing your holder protects against wear, providing for longer tool life while enhancing reliability and performance. It is recommended to grease the holder every few hours on a constant run. Grease is also an important part of the rotary broaching process as it helps prevent oxidation of precision tool holder components.

PARTS AND ACCESSORIES

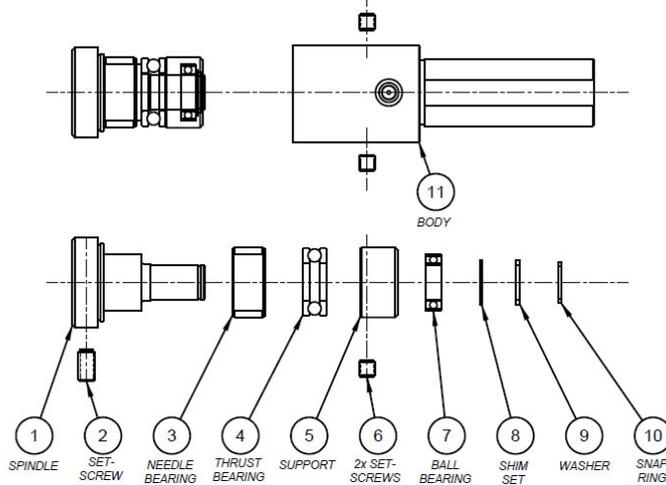

REBUILD/REPLACEMENT PARTS

The ability to replace parts is an important feature of our tool holders, allowing Slater Tools customers to increase longevity and enjoy our products for years to come. Replacement parts are available for all of our Rotary Broach Tool Holders from stock and for immediate delivery. Please visit www.slatertools.com to view tool holder part breakdowns. Email or call with your tool holder part number to get a quote on the proper replacement parts.

- Rotary Broach Tool Holder's main components can be purchased individually: **spindle, body, bearings, or adaptor (shank)**
- **Sub-Assemblies** consist of the tool holder spindle, body, and bearings
- **Bearing Rebuild Kits** include ball bearing, needle bearing, thrust bearing, snap ring and space shims
- **Setting plugs** used for centering Internal and External Adjustable Rotary Broach Tool Holders are available

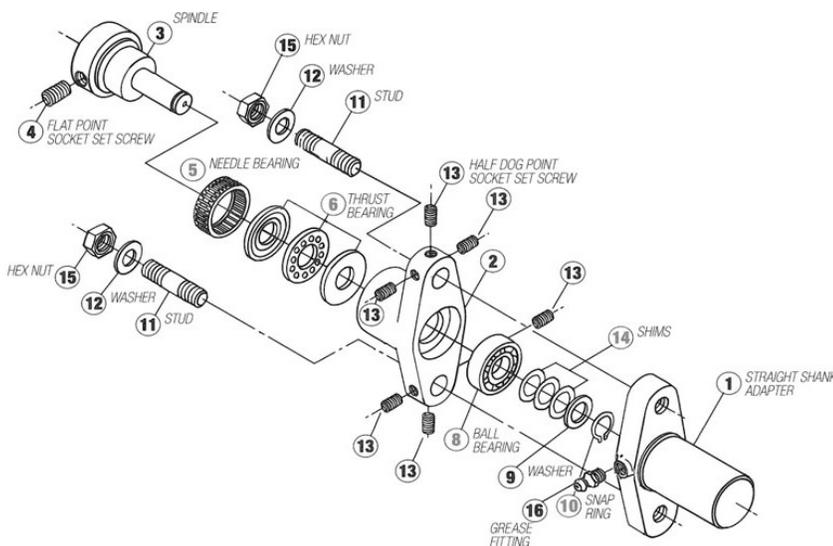

If you prefer a skilled technician to evaluate your holder, please see page 39 for details. **Factory repairs** are completed within 48 hours.

PART PREPARATION GUIDE

INTERNAL BROACHING PART PREPARATION

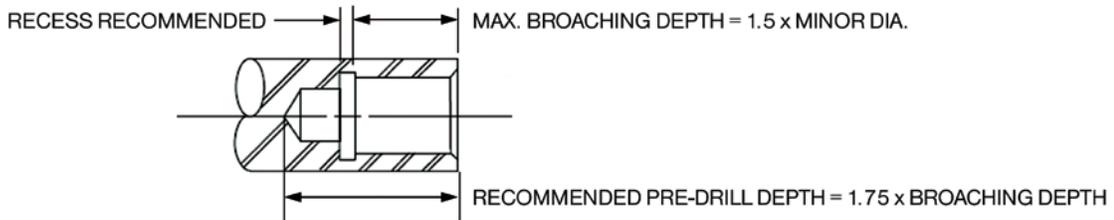

Pre-Drill Hole Diameter:

- A pre-drill hole is required for internal broaching.
- The pre-drill hole must be at least equal to the minor diameter of the broach. It is strongly recommended to open the hole diameter larger than the minor diameter.
- See below formulas for recommended pre-drill hole diameters of hex and square forms.

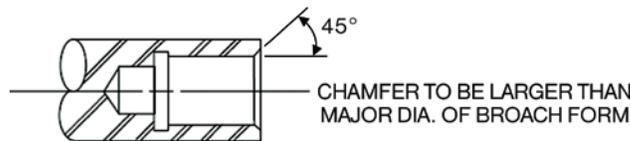

Pre-Drill Hole Depth:

- The depth of the pre-drill hole must be greater than the broaching depth to allow for chips to accumulate and avoid excess packing.
- If chips must be removed after broaching, it can be done with a drill or boring tool. A recess at the bottom of the pre-drill will allow the chips to break cleanly. The recess diameter should be larger than the major diameter of the broach.
- It is recommended to have a pre-drill depth of 1.75 x depth of broached area.

Lead Chamfer:

- A 45° lead chamfer must be provided for successful internal rotary broaching, going from the major diameter to the minor diameter of the form.

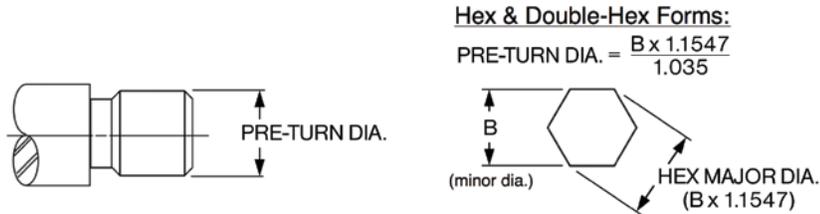

EXTERNAL BROACHING PART PREPARATION

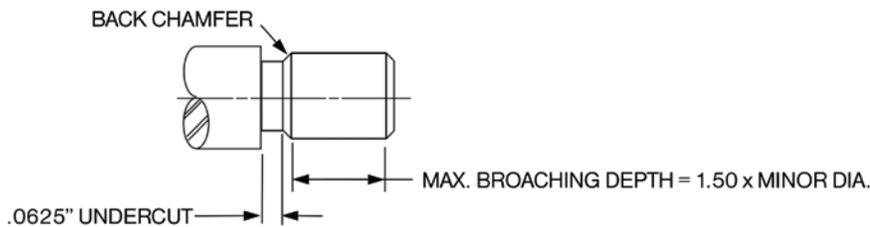

Pre-Turn Diameter:

- Pre-turning the diameter of the workpiece is required for external broaching.
- The pre-turned diameter must be smaller than the major diameter of the broach.
- It is recommended to turn the workpiece diameter to the smallest allowable diameter so the broach will clear on the major diameter. Allowing for more clearance will reduce the required broaching pressure and increase tool life.
- See below formulas for recommended pre-turn diameters of hex and double-hex forms.

External Form Depth:

- Maximum recommended broach depth is 1.5 x minor diameter of form.
- A back-chamfer or undercut will allow chips to break cleanly. The undercut should be a approximately .0625" wide.

Lead Chamfer:

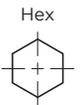

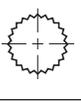

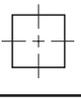

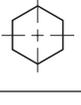

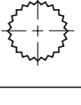

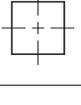

- A 45° lead chamfer must be provided for successful external rotary broaching, going from the minor diameter to the major diameter of the form.

- The table is provided as a reference to compare loads between various forms, sizes and materials.
- Rotary broaching is a cutting process, requiring very little pressure (low axial machine loads).
- Minimal pressure is generated when following Slater Tools' workpiece preparation recommendations. See pages 34 and 35.
- The tool holder takes the brunt of the broaching forces, not the machine.
- Actual loads should be less than the values in the table.

RECOMMENDED SPEEDS & FEEDS

COMMON WORKPIECE MATERIALS & FORM SIZES

- This chart is provided as a reference to give starting point recommendations.
- Contact Slater Tools for the best solutions on your specific application.
- Larger external applications may require higher speeds or feeds.
- Slater Tools can also assist you with applications in plastics.
- In all materials, the smaller the broach diameter the lighter the feed should be.
- Lower feed rates give better workpiece finish. However, feed rates under 0.004 ipr can cause chips to lose flowing motion, creating excessive end loading pressure.
- Use rapid traverse when retracting off or out of a part.
- Mimimum and Maximum Conditions:
Speeds 400-3500 RPM (revolutions per minute)
Feeds 0.003-0.009 ipr (inches per revolution)

ADJUSTABLE TOOL HOLDER SET-UP STEPS

STEP 1 - Measure "L" length of broach and record.

STEP 2 - Insert setting plug and scribe "L" length measurement.

STEP 3 - Mount the Rotary Broach Tool Holder in the turret and position the tool holder so that the cutting portion of the Rotary Broach ("L" length scribed line) is as close to the work zero point as possible.

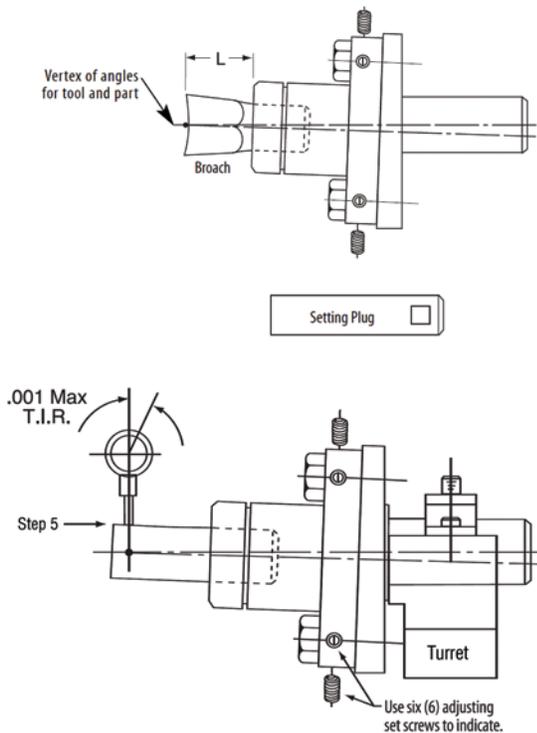

STEP 4 - Slightly loosen two (2) hex nuts located on flange of Rotary Broach Tool Holder.

STEP 5 - Mount a magnetic base dial indicator on the chuck and place needle on scribed "L" line. Using six (6) adjusting set screws, indicate tool holder to a maximum of .001 total indicator reading (T.I.R.). This is done by rotating the chuck, NOT the Rotary Broach Tool Holder (use of a telescoping inspection mirror is recommended).

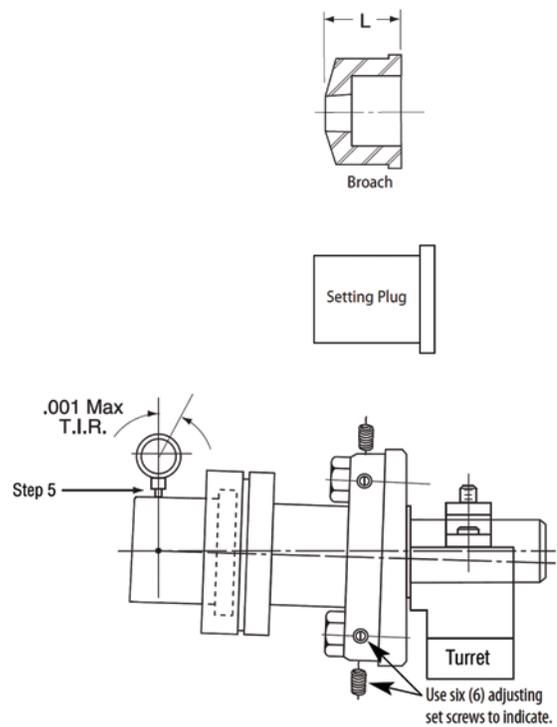

FINAL STEP - Lock two (2) hex nuts and snug all six (6) adjusting screws against studs. Recheck against possible movement and secure Rotary Broach into Rotary Broach Tool Holder spindle.

INTERNAL TOOL HOLDER

EXTERNAL TOOL HOLDER

FLUIDS & TOOL CARE

CUTTING FLUIDS

Fluids play a minor role in rotary broaching. Any type of water or oil based fluid is acceptable. The chip is a flowing type and the amount of heat generated is very minimal.

When internal rotary broaching in blind holes, fluids should be applied on the broaching tool tip prior to contacting workpiece and not inside of workpiece pilot hole. Trapped fluid sometimes is unable to escape causing inability to broach to full depth. Slater Tools offers vent holes and double vent holes for customers who are concerned about trapped fluids. Opening your pre-drill hole to larger than the minor diameter of form as recommended will alleviate pressure from fluids.

For external rotary broaching, fluids may be applied prior to or continuously on the workpiece diameter.

LUBRICATION OF HOLDER

Lubricate every few hours of continued usage. After lubrication, hand rotate spindle to relieve pressure caused by greasing. Slater Tools offers and recommends Mobiltemp SHC 32[©]. This is a clay thickened, synthetic, dark red grease. Do not use grease containing graphite. Mobiltemp SHC 32[©] is available from Slater Tools.

REPLACEMENT PARTS

Replacement parts for Slater's Rotary Broach Tool Holders are available from stock. Orders placed before 4:30 p.m. EST will be shipped that same day. See page 33 for more information on replacement/rebuild parts.

FACTORY REPAIRS

If you would like a skilled technician to evaluate your Slater Rotary Broach Tool Holder, simply send us your holder "Attn: Repairs". Upon receipt, an evaluation and price quote will be submitted for your consideration. Once we receive your authorization, the holder will be repaired and sent back to you the same day.

RE-SHARPENING BROACHES

Slater Tools offers broach re-sharpening for both internal and external Rotary Broaches. Re-sharpened broaches can be ready within 48 hours of receipt. Please include contact information, mark "Attn: Re-sharp" on your paperwork, and indicate the low limit of the tolerance for internal broaches and the high side of your tolerance for external broaches.

Mailing Address:

Slater Tools, Inc.

TROUBLESHOOTING SOLUTIONS

If you have any technical questions or concerns, Slater Tools' experienced associates and engineers are readily available to assist you. Please call or visit our online Customer Support & Service section and instructional videos at www.slatertools.com.

ISSUE	POSSIBLE CAUSES	RECOMMENDATIONS
Machine is alarming / stalling	<ol style="list-style-type: none"> 1. Broach Holder is off-center 2. Broach Holder bearings failing 3. Excessive chip accumulation 	<ol style="list-style-type: none"> 1. Make sure the Adjustable Tool Holder is centered correctly (see page 38, or view videos at www.slatertools.com). 2. Check the Broach Holder bearings by turning the spindle in your fingers. The spindle should spin freely. If you feel hesitations, graininess, or stickiness, replace the holder bearings. Bearing Rebuild Kits with instructions are available. Slater Tools offers inspection and repair services. 3. Typical solutions to reduce chip accumulation: <ul style="list-style-type: none"> • For Internal Broaches, increase pre-drill size (larger workpiece I.D.) • For External Broaches, pre-turn dia. smaller (smaller workpiece O.D.) • Reduce depth of broached area (less than 1.5 x Minor Dia.) • Add an undercut or recess to help break the chip
Skid / witness marks on chamfer of workpiece	<ol style="list-style-type: none"> 1. Broach is bouncing off the face of the workpiece at initial contact 	<ol style="list-style-type: none"> 1. Reduce the speed to approx. 100-200 RPM during initial contact into the chamfer (maintaining feed rate). Then, increase the speed back to the recommended RPMs once tool is .010" into the chamfer. Consider leaving extra stock on workpiece and clean-off after broaching.
Spiraling form / form is getting smaller towards bottom	<ol style="list-style-type: none"> 1. Excessive chip accumulation 2. Broach Holder bearings failing 	<ol style="list-style-type: none"> 1. Typical solutions to reduce chip accumulation: <ul style="list-style-type: none"> • For Internal Broaches, increase pre-drill size (larger workpiece I.D.) • For External Broaches, pre-turn dia. smaller (smaller workpiece O.D.) • Reduce depth of broached area (less than 1.5 x Minor Dia.) • Add an undercut or recess to help break the chip 2. Check the Broach Holder bearings by turning the spindle in your fingers. The spindle should spin freely. If you feel hesitations, graininess, or stickiness, replace the holder bearings. Bearing Rebuild Kits with instructions are available. Slater Tools offers inspection and repair services.
Workpiece / stock is pushing back into the machine	<ol style="list-style-type: none"> 1. Workpiece not held tight 2. Excess pressure is created by trapped fluids/air 3. Excessive chip accumulation 	<ol style="list-style-type: none"> 1. Use a serrated collet to hold the workpiece. 2. Typical solutions for releasing trapped fluids/air: <ul style="list-style-type: none"> • Turn off coolant during broach cycle • Increase the pre-drill hole size (increase I.D.) • Use a vented broach. Slater Tools offers vented broach options. 3. Typical solutions to reduce chip accumulation: <ul style="list-style-type: none"> • For Internal Broaches, increase pre-drill size (larger workpiece I.D.) • For External Broaches, pre-turn dia. smaller (smaller workpiece O.D.) • Reduce depth of broached area (less than 1.5 x Minor Dia.) • Add an undercut or recess to help break the chip

ISSUE	POSSIBLE CAUSES	RECOMMENDATIONS
Broach tool chipping / poor tool life	<ol style="list-style-type: none">1. Broach Holder is off-center2. Broach Holder bearings failing3. Improper workpiece preparation4. Speed is too high (RPM)	<ol style="list-style-type: none">1. Make sure the Adjustable Tool Holder is centered correctly (see page 38, or view videos at www.slatertools.com).2. Check the Broach Holder bearings by turning the spindle in your fingers. The spindle should spin freely. If you feel hesitations, graininess, or stickiness, replace the holder bearings. Bearing Rebuild Kits with instructions are available. Slater Tools offers inspection and repair services.3. Check workpiece geometry:<ul style="list-style-type: none">• Refer to the part preparation guide (page 34-35)• For Internal Broaches, increase pre-drill depth and size (larger I.D.)• For External Broaches, pre-turn dia. smaller (smaller O.D.)• Ensure there is a 45° lead-in chamfer (ideal)• Consider broaching material in annealed state4. Refer to speeds and feeds chart on page 37 (also available at www.slatertools.com, or contact us for recommendations).
Form is larger than the broach	<ol style="list-style-type: none">1. Broach Holder bearings failing2. Too much end play in holder	<ol style="list-style-type: none">1. Check the Broach Holder bearings by turning the spindle in your fingers. The spindle should spin freely. If you feel hesitations, graininess, or stickiness, replace the holder bearings. Bearing Rebuild Kits with instructions are available. Slater Tools offers inspection and repair services.2. Measure holder end play. If end play is more than .005", replace the bearings. Bearing Rebuild Kits with instructions are available. Slater Tools offers inspection and repair services.
Form not centered / teeth larger on one side	<ol style="list-style-type: none">1. Broach Holder is off-center2. Workpiece deflection	<ol style="list-style-type: none">1. Make sure the Adjustable Tool Holder is centered correctly (see page 38, or view videos at www.slatertools.com).2. Reduce speed during initial contact (maintain feed rate). Support the workpiece to ensure there is no deflection.

COMMON QUESTIONS

I do not see the size broach I am looking for listed. Can you make the broach I need?

Answer Yes. We can produce any size hex or square in only 1-2 days. All other custom broaches have a 5-10 day lead time.

What materials can I broach?

Answer A wide variety of materials commonly cut during machining can also be broached using Rotary Broach Tooling from Slater Tools. Common materials include soft metals such as aluminum, brass, alloy metals, stainless steel, plastics and carbon fiber. Tensile strength of the material plays a large role in how the material will respond to broaching. The higher the tensile strength, the more difficult it may be to rotary broach. Although we may not recommend broaching certain materials, this does not mean they cannot be broached. Sometimes by opening up your pre-drill diameter or broaching a shallow depth, rotary broaching can be successfully accomplished but tool life may be reduced.

What type of fluid should I use during the broaching process?

Answer Fluids play a minor role in rotary broaching. Any conventional water or oil based fluid is acceptable. Many customers choose to turn off the coolant during the rotary broaching cycle.

When mounted in a mill, why does my holder look like it is wobbling?

Answer The holder is built on a 1 degree angle. This design reduces broaching pressure and causes the holder to look like it is wobbling. Do not alter the holder's 1 degree angle.

How do I remove the chips from my part?

Answer Add an undercut or recess before broaching to allow the chips to break cleanly. You can also rebores or flat bottom drills after internal broaching.

What will happen if I do not pre-drill or pre-turn the diameter to the recommended size?

Answer While it is possible to remove full-form, you will likely see a significant reduction in tool life of the broach. There is also potential for premature bearing wear of the tool holder or excessive pressures that may alarm your machine.

What is the largest form I can rotary broach?

Answer We are able to produce internal broaches up to 2.30" and external forms up to 1.80" in diameter. The ability to successfully broach these forms is application specific and will depend on the type of material you are broaching and the depth of broached area. If you have questions about an application, it is always best to call or send us a print.

What information do I need to provide for checking feasibility of rotary broaching?

Answer We will need to know the shape, major diameter, minor diameter, material and broaching depth. We recommend sending us a portion of your print of the area to be broached.

How deep am I able to broach?

Answer As a general rule, you should not attempt to broach more than 1.5 times the minor diameter of the form. Depending on the type of application and the material you are broaching, this could be reduced or increased. It is always best to send us a portion of your print to ensure you will be able to successfully rotary broach.

ROTARY BROACHING TECHNICAL SUPPORT

Design • Engineer • Manufacture • Support

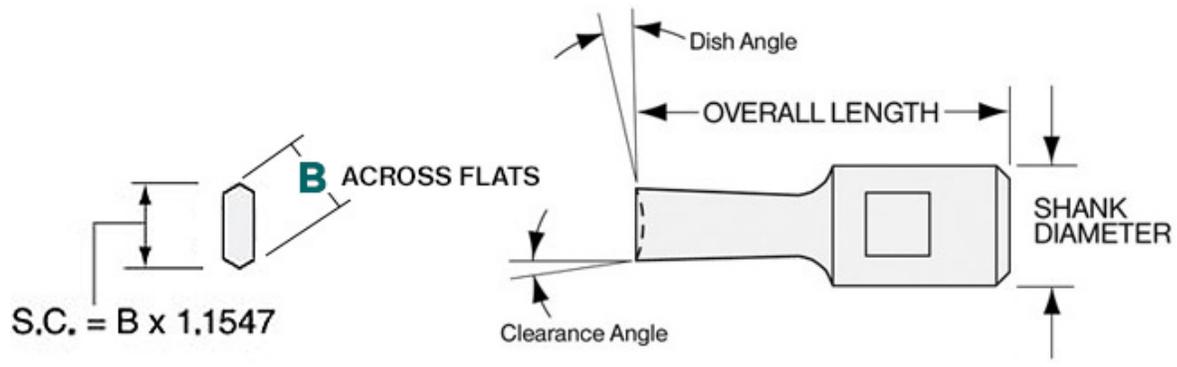

HEX PUNCH BROACHES

Slaters Tools' Hexagon Punch Broaches are manufactured as two-point forms and facilitate punch broaching on CNC lathes, mills and presses. By using partial form broach tools and indexing the tool or workpiece, cutting pressures are greatly reduced. This method of broaching is most beneficial for applications requiring no witness (pre-drill) marks, excessive material removal, or timing of the form to a feature on the part.

SIX LOBE PUNCH BROACHES

Created with two opposing lobes, Slater Tools' Six Lobe Punch Broach Tools are used to produce hexalobular or Torx-type forms in tough applications on CNC lathes and mills. The Six Lobe punches are designed to conform with ISO 10664 and can be manufactured out of different materials and with coatings. These tools are especially beneficial when needing to create full form hexlobes and when broaching difficult-to-machine materials.

KEYWAY PUNCH BROACHES

Produce keyways in blind or through holes with Slater Tools keyway slotting tools. Slater Tools' Keyway Punch Broaches allow full form keyways to be produced on your CNC machine. Also known as single point keyway tools, the form is created in the work piece by slotting a portion of material and incrementally indexing the machine forward until the desired key height is achieved.

Keyway punch broaches are designed to meet ANSI B17.1, DIN-6885, and ISO R773 Standards. They are also available in non-standard geometries. Engineered to optimize tool life, Slater's keyway punch broaches allow for multiple re-sharpenings.

INDEXABLE PUNCH BROACH HOLDERS

Slater Tools' Indexable Punch Broach Holders facilitate punch broaching on CNC lathes and mills. By using partial form broach tools and indexing either the tool or the workpiece, Slater Tools' punch broach holders provide the rigidity necessary to make this type of machining successful and prevents the broach or holder from backing up from pressure. The punch broach holder is precision ground and has multiple flats for easier indicating of the tool and increased repeatability. This is especially helpful in applications that need to have the form timed to another feature in the workpiece.

PART PREPARATION GUIDE

INDEX AND SINGLE POINT PUNCH BROACHING PART PREPARATION GUIDE

Pre-Drill Hole Diameter:

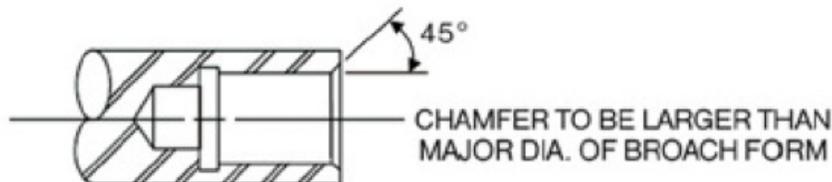

- A pre-drill hole is required for index punch broaching.
 - The pre-drill hole must be at least equal to the minor diameter of the finished form. It is strongly recommended to open the hole diameter larger than the minor diameter.
 - For keyway and single point broaching, the pre-drill hole must be equal to the finished keyway bore or minor diameter

Pre-Drill Hole Depth:

- The depth of the pre-drill hole must be greater than the broaching depth to allow for chips to accumulate and avoid excess packing.
- It is recommended to have a pre-drill depth of 1.75 x depth of broached area.
- For full form or two corner punch broaching:
 - A recess at the bottom of the pre-drill is recommended. This will allow the chips to break cleanly. The recess diameter should be larger than the major diameter of the broach. Alternatively, if chips must be removed after broaching, it can be done with a drill or boring tool.
- For keyway and single point broaching:
 - A recess at the bottom of the pre-drill is mandatory and should be larger than the major diameter of the final keyway or tooth height.

Lead Chamfer:

- A 45° lead chamfer must be provided for successful index punch broaching, going from the major diameter to the minor diameter of the form.

SET UP PARAMETERS

FULL FORM OR TWO CORNER PUNCH BROACHING

- Position broach tool a sufficient distance away from face of workpiece to allow for acceleration to full cutting speed
- Use machine's peck mode and feed to the desired depth. Alternatively, program the machine to rapid in and then retract the tool in .005 increments
- Spindle lock or ability to program lock is required

KEYWAY OR SINGLE POINT PUNCH BROACHING

- Position the tool at least 1" away from face of workpiece to allow for acceleration to full cutting speed (otherwise could contribute to deflection or tapering)
- .0008-.0015" doc per pass/ 200-550 IPM (inches per minute)
- After feeding to desired depth, program machine to drop down away from tooth
- Chip must break off completely after each pass; program tool to enter into relief groove (blind hole) or pass end of part (through hole)
- Spindle lock or ability to program lock is required

HEXAGON PLUG GAGES

Slater Tools manufactures both standard and custom sized hexagon inspection gages. Use our Go and No-Go Gages to inspect your parts for machining process variations such as form size, twist, tool wear, etc.

Slater Tools Hex Gages are held to extremely tight tolerances (+0/-.0002) with extremely fast delivery times. Go/ No-Go Gages are precision ground from oil hardened M2 high speed steel and can be custom made to any shape or size to fit your specific application. Long form gage certification is also available on all internal and external gages.

SIX LOBE PLUG GAGES

Slater Tools Six Lobe Plug Gages are used for validating part specifications for hexalobular/six lobe, also known as Torx-type, internal forms. Six Lobe plug gages are held to extremely tight tolerances (+0/-.0002) with extremely fast delivery times. Go/ No-Go Gages are precision ground from oil hardened M2 high speed steel and are available as a set or single ended. Long form gage certification is also available on all internal and external gages.

INTERNAL GAGE SPECIFICATIONS:

- Gages are available as Go/NoGo sets or as single ended gages
- Each gage order comes with single or double-ended handle
- Long form gage certification is available upon request
- Custom plug gages per customer specifications can be manufactured
- Ideal for use with Slater Tools Rotary Broaches
- Manufacturing tolerances are held within .0002 inches (.005 mm)

EXTERNAL HEXAGON RING GAGES

Slater Tools manufactures standard and custom external hexagon ring gages held to extremely tight tolerances with extremely fast delivery times. Standard external hexagon ring gages are made to ANSI/ASME B18.2.1 (B18.2.3.1M) for Hex Cap Screws (finished hex bolt). Use our Go and No-Go Gages to inspect your parts for machining process variations such as form size, twist, tool wear, etc.

CUSTOM PLUG AND RING GAGE ORDER PROCESS:

- Please submit a portion of your print showing the form to be gaged and tolerances
- Please indicate whether you would like the gages to be certified
- You will receive a quote within 24 business hours
- Once the order is placed, we will design your gages and submit a drawing for your approval

90° FEMALE	7/32"	3/8"	CLR-0215
90° FEMALE	15/32"	3/8"	CLR-0216
90° FEMALE	19/32"	25/64"	CLR-0217

SPECIFICATIONS:

- Precision bearing placement for greater rigidity required by Live Centers
- Independent inner housings provide rigidity while allowing the live center shaft to retract with workpiece
- Spring loaded design compensates for variations, without damage to the work piece or center tip. This assures the operator of uniform constant tension
- Interchangeable Live Center points offer versatility; reducing inventory, costs, and down time
- Point configuration is designed to meet required tool clearance
- Female and male point centers provide excellent support, and prevent deflection of long parts while machining
- Retractable spring loaded centers combined with an independent inner housing empowers you with the ultimate design in live centers available to the turning industry

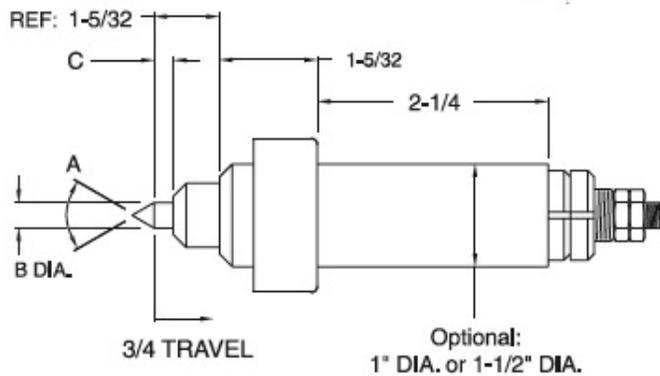

MALE POINT LIVE CENTER ASSEMBLIES

Slater Tools' 1" and 1.5" diameter Male Point Spring Live Centers are offered with a 60 or 90 degree male point in various sizes. Male or female points can be purchased separately and interchanged with this unit, reducing inventory, cost and downtime.

SPRING LIVE CENTERS

FEMALE CENTER POINTS

Slater Tools' female center points are manufactured from high-quality hardened tool steel. They can be easily interchanged in Slater Tools' 1" or 1.5" inch Spring-type Live Centers, allowing for maximum flexibility with different workpiece types. Many sizes are available from stock for same day delivery. Custom point configurations are also available upon request.

BORING BAR TOOL HOLDERS

The high precision head of this Boring Bar Tool Holder is designed and ruggedly built for heavy cuts and accurate bore sizing for large volume production runs. Slater Tools' Boring Bar Tool Holders use industry standard boring bars, reducing the need for special tooling. Tool bores are ground concentric with the shank and can be used for trepanning. The double hole is designed to accommodate a larger range of bore sizes. All moving parts on this tool holder are hardened and ground.

SINGLE HOLE BORING HEADS

CUT-OFF BLADE HOLDERS

This Cut-Off Blade Holder holds T-style cut-off blades, also available from Slater Tools. Both Cross-Slide and Intermediate Side-Slide Holders are available, giving the flexibility for any designated position. There is in stock availability for most screw machines.

T-STYLE CUT-OFF BLADES

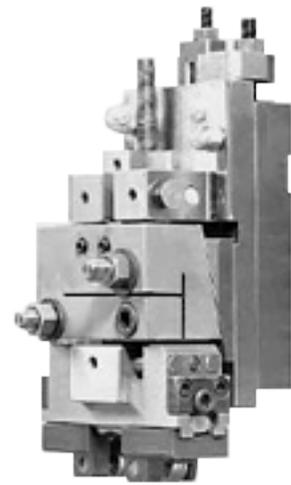

Slater Tools' T-shaped Cut-Off Blades are made of premium high speed tool steel and have excellent tool life. They are all-purpose T-Type blades that fit into Slater Tools' Cut-Off Blade Holder Inserts.

DAVENPORT UNIVERSAL VERTICAL SLIDE

Update your Davenport with Slater Tools' universal type slide. It will give you a new approach to tooling, eliminating the need for special tooling or semi-standard setups. No alterations are required for mounting. No adjustments of other stations are needed to work with a stationary 4th position slide. It will enable you to save time on initial job setups, on minor adjustments during job runs, and when changing from one job to another. It accepts up to six types of tool holders. Tooling options are available for the Fourth "D" Position.

Position	Machine Model	Part #
Fourth "D"	Model "B": 5/8" or 7/8"	SVS-7340

DAVENPORT SWING ARM

Slater Tools' Davenport Swing Arm is suited for holder blocks in the third position. This product allows for versatility of holder use. Use Slater Tools' Shank-type Knurling, Shaving, and Skiving mounting blocks in the third position with the Davenport Swing Arm.

Position	Machine Model	Part #
Third "C"	Model "B": 5/8" or 7/8"	SSA-7103

FORMING TOOLS

Slater Tools offers many types of forming tool holders and double decks. Every job has its own unique conditions, and each condition calls for a different type of form tool. To form at the tool's full potential, familiarize yourself with several individual features of the application- shape of work, width and depth of cut, for rough forming or finishing operations, location of tool holder in relation to other tools in the set-up, type of material, and speeds and feeds at which the work is done.

KNURLING TOOL HOLDERS

Slater Tools' straddle-type Knurl Holders increase machine life and save on set-up time and maintenance costs. These Knurl Tool Holders come in either a cross-slide or end-slide configuration. Adaptor blocks allow the holders to fit most makes, models, and sizes of machines. Holder assemblies are designed to compensate for any slight misalignment with the centerline of the spindle. Size control is made easy through simultaneous adjusting of both knurl roll holders. There is no extra expense for tooling since these tool holders use standard, commercially available knurl rolls.

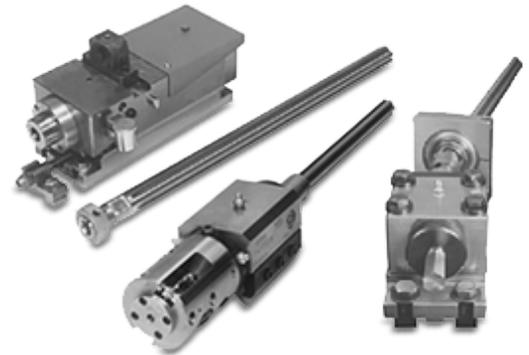

RECESS TOOL HOLDERS

Slater Tools offers Recess Tool Holders, Recess Tool Blanks and Recess Attachments for various types of screw machines. Recess Tool Holders are available in different styles and sizes depending on your machine make, model, and size.

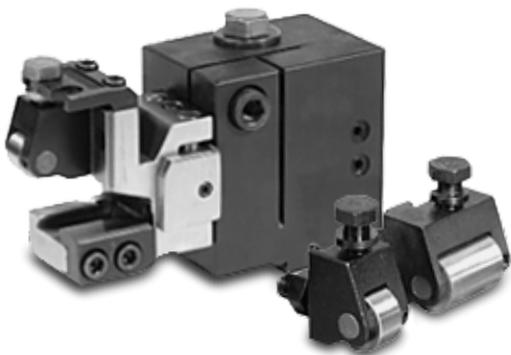

SHAFT-DRIVEN ATTACHMENTS

Screw machines are highly efficient and cost effective. No other machine can produce the quantity and variety of small parts for such a low cost as a screw machine. Specific attachments can increase productivity while optimizing the screw machine's efficiency. Attachments on the standard screw machine allow for shorter lead-times and tighter tolerances. The extended capability that Slater Tools' attachments offer, allows screw machines to accommodate more complex workpieces.

SHAVING TOOL HOLDERS

Slater Tools offers Shaving Tool Holders, Shaving Tool Blanks, Shaving Roll Rests and other accessories for various types of machines. Shaving will produce round diameters on size within +/- .0005. With these shaving tools, contours can be produced that would otherwise only be possible by tracing. By its nature, shaving can almost always be completed in fewer revolutions than an end-working operation. Shaving also has its built-in diameter controls; it does not rely on exact cross slide stroke length for accuracy, and to a certain extent, it can compensate for index or spindle errors.

SKIVING TOOLING

Skiving Tool Holders from Slater Tools are for single & multiple spindle automatics and turret lathes. Make your toughest cuts within seconds. Obtain exceptionally smooth skiving finishes and quicker tool resharpener with easy tool removal. Slater Tools' Skiving Tooling is manufactured to have what it takes to uphold performance. Slater Tools' shave tool blanks may also be used as skive tool blanks.

SUPPORTS

It is recommended to support any workpiece that is long in relation to its diameter. In order to prevent the workpiece from moving under the cut, use Slater Tools' supports. All Slater Tools supports come with rolls and pins, and replacement parts are also available. Supports are available for Acme, New Britain, Cone, Warner & Swasey, and Wickman machines.

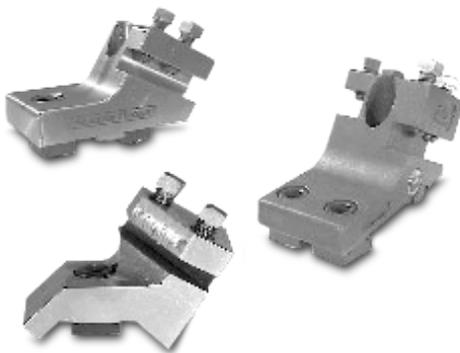

T-SLOT NUTS

It is vital to have strong T-Slot nuts to secure tooling to your screw machine. Slater Tools supplies the same standard and dovetail nuts used with our robust screw machine tooling as replacement parts for your machine.

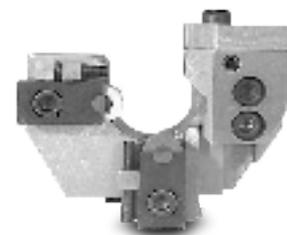

TURNING KNEE

Available for most end-slide positions in plain, reversible, or angular 45 degrees. The Turning Knee uses standard tool bit tooling. Turning Knee Reversible tool bits can changeover for use in multiple positions. Turning Knees are available for most types of screw machines including Acme, New Britain, Cone, Warner & Swasey, and Wickman Machines. For flat, angular or radius base, please specify your machine make and model.

TURNING ROLL TURNER

Support and turn your screw machine part simultaneously. Slater Tools' Turning Roll Turners are available for most end-slide positions. Either flat, angular or radius bases are available for Acme, New Britain, Cone, Warner & Swasey, and Wickman machines. These Turning Roll Turners use standard tool bit tooling. With this tool, you are able to support parts ahead of or behind the cut.
